

BOT BLOCKCHAIN ECOSYSTEM • NOVEMBER 2026

HOLDR

Trust-Minimized Onchain Escrow for Freelance Payments & Gig Economy

Network: **BOT Testnet (Chain ID 968)**

Contract: **0x012A03aC...0052b**

Status: **Verified on BohrScan**

The Broken State of Freelance Payments

The $1.5T global freelance economy is held hostage by extractive Web2 middlemen, chargeback fraud, and opaque dispute arbitration.

Extractive 10%–20% Platform Taxes

Legacy portals (Upwork, Fiverr) siphon up to 20% from service providers. Freelancers lose billions annually simply to secure basic payment guarantees.

Chargeback Fraud & Payment Freezes

Traditional payment processors (PayPal, Stripe) allow unilateral 180-day clawbacks and arbitrary account freezes, leaving contractors unpaid after work delivery.

Centralized Dispute Black-Boxes

When disagreements arise, anonymous customer support reps make arbitrary, unappealable rulings with zero cryptographic auditability, routinely siding with high-volume buyers.

Fragile Web3 Escrow Alternatives

Existing Web3 escrows rely on complex token staking, external IPFS pinning gateways that suffer broken links, or multi-week DAO voting procedures that stall payouts.

The Holdr Solution: Zero-Rent Escrow

A lightweight, trust-minimized escrow primitive engineered directly into Solidity with guaranteed dual timeouts and pull-based settlements.

0% Protocol Fees

No platform tax, no cut, and no admin rent extraction. 100% of escrowed BOT transfers directly from buyer to seller.

100% Onchain Strings

Titles, deliverables, delivery notes, and dispute reasons are stored directly in Solidity state as plain UTF-8. No IPFS or servers.

Pull-Based Payouts

Reentrancy-hardened vault using **pendingBalance** and **withdraw()**. Reverting recipients cannot grief other parties.

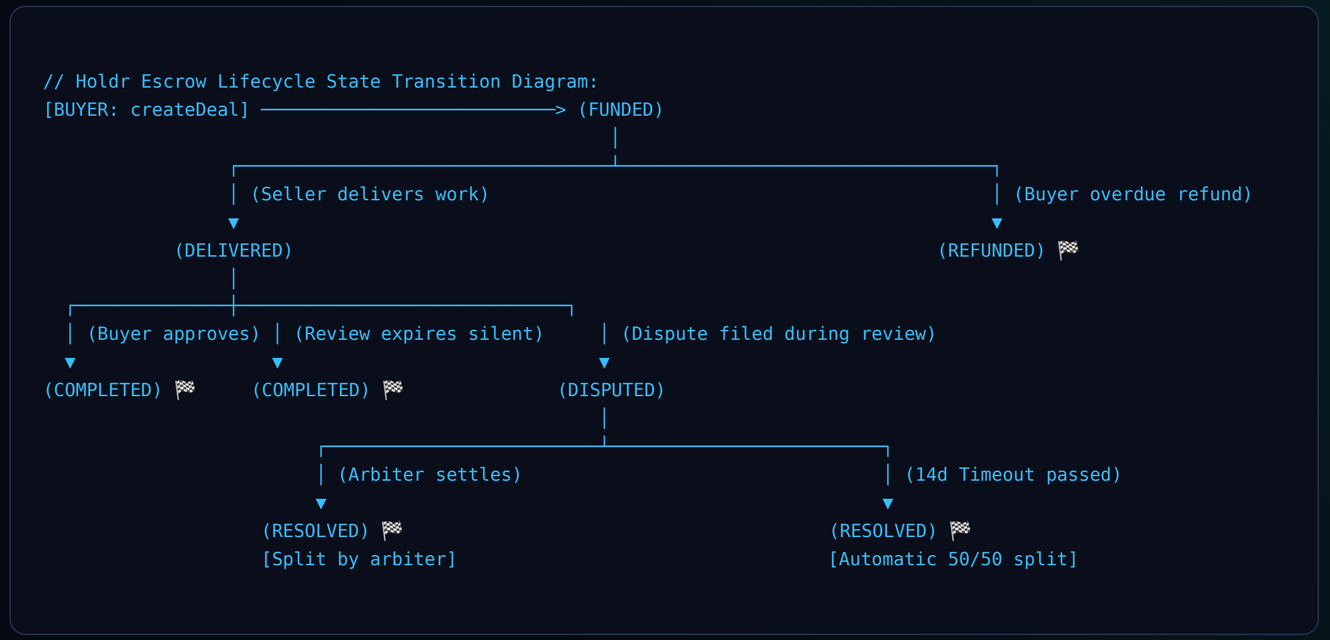

Guaranteed Timeouts

Overdue refunds, silent-buyer claims, and a 14-day arbiter 50/50 fallback split ensure nobody can be trapped forever.

Smart Contract State Machine & Auditing

Built on Solidity 0.8.24 and OpenZeppelin 5.x ReentrancyGuard, backed by 49 exhaustive tests and deep invariant proofs.

49 Passing Foundry Tests

100% PASS RATE

Unit tests covering zero-values, address duplicates, boundary checks, time-travel (`vm.warp`), and reentrancy attack blockers.

128,000 Invariant Fuzz Calls

ZERO REVERTS

Mathematical invariant proof: `holdr.balance == activeDealsSum + totalPendingBalance` across all random actions.

No Admin Backdoors

IMMUTABLE

No owner, no pausing, no upgradability, no fee collection. Funds can only ever be touched by designated deal parties.

Live & Verified on BOT Testnet

Deployed with Foundry script, fully verified on BohrScan Blockscout explorer, and ready for production testing.

968

CHAIN ID (BOT TESTNET)

Official testnet RPC: **https://rpc.bohr.life**

2.73M

DEPLOYMENT GAS USED

Gas-optimized Solidity 0.8.24 with 200 optimizer runs.

100%

BLOCKSCOUT VERIFIED

Fully verified source code and ABI on BohrScan.

Fintech-Grade DApp Experience

A purpose-built interface designed for clarity, security, and trustless collaboration across counterparty roles.

🎛️

Role-Aware Action Engine

The UI inspects the connected address and deal state to render only actions valid for that user at that exact moment (seller delivery note, buyer release, dispute claim, arbiter split slider).

🔗

Shareable Hash Routing

Every deal generates a direct link (`#/deal/:id`). Buyers can instantly share deals with sellers or arbiters. A global lookup bar allows querying any deal ID.

⏳

Visual Stepper & Timers

Live countdowns for delivery deadlines, review windows, and arbiter timeouts. Interactive milestone stepper tracks Funded → Delivered → Completed/Disputed → Resolved.

Equilibrium & Anti-Griefing Safeguards

Engineered so no party—buyer, seller, or arbiter—can stall funds or maliciously freeze an escrow deal.

1. Mutual Arbiter Selection

The buyer names the arbiter during creation; the seller reviews the arbiter before initiating work. Arbiters possess fine-grained allocation control (0% to 100% to seller, remaining to buyer).

2. 14-Day Inactive Arbiter Defense

If an arbiter goes missing or refuses to rule, either the buyer or seller can invoke `splitAfterArbiterTimeout()` after 14 days, settling 50/50 with odd wei to buyer.

3. Silent Buyer Protection

If a buyer fails to review work within the review window (1–14 days), the seller can unilaterally claim the entire locked amount via `claimAfterReview()`.

4. Malicious Recipient Isolation

Since all funds are credited to `pendingBalance`, an uncooperative contract that reverts upon receiving BOT cannot revert other users' deals or transactions.

Ecosystem Catalyst for the BOT Network

Holdr serves as foundational payment infrastructure for contractors, DAO bounties, and autonomous AI agents.

🤖

AI Agent Gig Economy

Autonomous AI agents on the BOT Network hiring human designers, developers, or secondary bot nodes can use Holdr as a trustless, programmatic escrow API.

⚡

BOT Token Velocity & TVL

Milestone funds are locked in the contract for days to weeks, driving organic Total Value Locked (TVL) and continuous transaction volume through state updates.

🌐

Frictionless B2B Web3

Allows pseudonymous contributors to collaborate globally without KYC, currency conversions, or payment gateway account shutdowns.

Strategic Roadmap

Phased execution moving from testnet validation to mainnet scaling and developer SDK distribution.

PHASE 1 (Q4 2026)

Foundation & Testnet

- ✔ Solidity 0.8.24 Holdr contract
- ✔ 49-test Foundry test suite (unit + invariant)
- ✔ BOT Testnet deployment & verification
- ✔ React + Vite + viem frontend DApp
- ✔ Full branding & pitch deck delivery

PHASE 2 (Q1 2027)

Mainnet & Milestones

- • BOT Mainnet deployment
- • Multi-milestone deals per contract
- • Arbiter reputation & settlement indexer
- • Webhook notifications for milestones
- • Optional arbiter incentive splits

PHASE 3 (Q2 2027)

Protocol SDK & Scaling

- • Holdr Checkout SDK for marketplaces
- • Ecosystem token support alongside native BOT
- • Decentralized multi-sig dispute pools
- • Cross-chain freelance escrow channels
- • Comprehensive professional audit

Decentralize Trust. Power the Gig Economy.

Holdr removes the middleman, eliminates chargeback risk, and brings uncompromised payment security to freelancers worldwide on the BOT Network.
